

Goal of this project is to create application that could serve as an academic department's bulletin board. This application should allow to create different types of records and even specify a new type during runtime. Types may for example include notifications about lectures, book reviews, job offers, news from other sources, etc. Records may be added through web interface or by sending an email to specified email address. Appearance of the pages can be personified according to every users need - it consists of windows with defined position, content (type of records + filters) and graphical features (eg. template - size, color, fonts, . . .). Project will also contain comparison of caching mechanisms and their impact on application performance.
